

Acid Neutralization Tanks

Acid neutralization tanks are storage tanks that contain chips of limestone to counteract acid in waste water. The limestone chips within the tank are used to neutralize acidic chemical contaminated water before it is discharged.

In order to ensure they are performing properly, acid neutralization tanks should be cleaned and the limestone chips be replenished every two years. If the water is not treated before it is disposed of you risk causing damage to the environment and could be held liable.

Karl Environmental Group trained professionals will perform on-site cleanout, and replenishment of your acid neutralization tanks.
